

A full PDF editor, inside your instance.

Annotate, fill, sign, reorganize and convert your PDFs without ever uploading them to a third-party conversion website — 118 operations, and every change becomes a restorable version.

WHAT YOU CAN DO

- ✓ **118 PDF operations.** Organize, convert, secure, annotate, clean up, validate — 19 categories in one catalogue.
- ✓ **Internal e-signature.** Place each signer's block, the order is respected, and every signature is sealed over exact bytes.
- ✓ **Comments and pages.** Read and reply to the document's comments; move, rotate and delete pages in a thumbnail grid.
- ✓ **Fill and sign without fields.** Text, ticks and a signature placed by hand on a scanned lease or an exported invoice.
- ✓ **Version history.** The last 10 versions of every PDF, labelled with what produced them, restorable in one click.
- ✓ **OCR for scanned documents.** A page with no text layer is detected, and recognition finally makes it selectable.

HOW IT WORKS

- 1 Open the PDF**
Like any document in your workspace — no separate tool, no upload to the outside.
- 2 Pick an operation**
From the document, the PDF workshop, a chat or an automation: one and the same catalogue.
- 3 It runs on your own server**
A job you can follow end to end, with its progress and a clear sentence if it fails.
- 4 The result becomes a version**
Dated, labelled with the reason that produced it, restorable — and written to the audit log.

- 118 operations, one catalogue

- 10 restorable versions

- PDF/A conformance validated

- Installed and operated by Hilo Tech

- ✓ Processing stays inside your instance, bar three named operations (vision OCR, timestamping, HTML rendering). The result is wiped on download; applying a tool takes a write licence.
